Let's Start!

What do you know about database software?

Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor. Represent the solution outline to the problem presented by the customer through making case of use diagrams, facing the problem to the customer following rules and protocols of the organization.

Ask your partner:

- How do organizations or companies usually store data?
- What is a web-based program? Can you list some examples?

Can Do Statements:

- I can talk about database and database software.
- I can discuss the use of Structured Query Language, SQL.
- I can say if I need MySQL or not.

Let's Explore!

Mr. Kapoor is talking about database software in his programming class.

Instructions: Read the text below.

- Mr. Kapoor:** Ok, class. Today, I'd like to show you why database software is necessary in our contemporary world. Let's start with the concept of database...Would you like to give me some ideas about it?
- Tim:** Me sir, a database is an assembly of information containing data such as contact information, tables, reports, files etc.
- Mr. Kapoor:** You're right Tim. Nowadays, regardless the size of an organization, people have to handle lots of information faster, and there you have the reason why they need to use database software. A database program helps to manage, store and retrieve any snippet of data easily.
- Lisa:** Would you like to explain us what language is used in that kind of software?
- Mr. Kapoor:** I was about to get there... To create database, we need to use SQL or "sequel", Structure Query Language. It is mainly a declarative language that also includes some procedural elements that allow users to insert, query, update and control data. I'd like you to take into account that SQL can perform these tasks thanks to the use of relational algebra and calculus.
- Tim:** In what kind of database management system does SQL work?
- Mr. Kapoor:** SQL works in systems such as RDBMS or in friends on the most popular in the case of stream processing...
- Lisa:** Why? Do we need to buy it?
- Mr. Kapoor:** No. It is free, everybody can have access to it.
- Lisa:** How do I know if my computer program or web-based program needs to use MySQL?
- Mr. Kapoor:** Well, you don't need to worry about it, you just have to check the system requirements page of your software and you'll know whether you need it or not. However, I'd like to clarify that if you are programming a blog, a photo gallery or a content management system, there you always need to put your page in a webhost using MySQL.

**Let's Practice!**

Would you like to use MySQL on your website?

Instructions: Proofread the sentences. Correct the mistakes.

1. I will like to know what a database is.

2. Mr. Kapoor, a database is an assembly to stores information.

3. Mr. Kapoor, a database is useful keep contact information and tables.

4. A database helps an organization to handling lots of information faster.

**Let's Practice!**

Let's identify the use of the SQL.

Instructions: Write the words to correctly answer the questions. Use words from the box below.

It includes procedural elements / It needs to use the SQL
It is the Structure Query Language. / It inserts and updates data.

1. Would you like to tell me what computer language is used in that kind of software?

2. Would you like to explain to me what the SQL is?

3. Would you like to tell me what the declarative language include?

4. Would you like to clarify what the purpose of the declarative language is?

Extension Activity

Now it's your turn to write about the use of Structure Query Language, SQL

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Find information about the use of Structure Query Language, SQL.
- Choose the main idea.
- Organize the information in a mind map.
- Explain to your partners the most important information about the SQL.

Self-Assessment

Yes

No

- I find information about the Structure Query Language, SQL. ☐ ☐
- I find the main idea about the use of SQL. ☐ ☐
- I organize the information in a mind map. ☐ ☐
- I explain to my partners the use of SQL. ☐ ☐

Target Words

- **declarative language** (noun): a programming paradigm in which the code indicates the objective of an operation, it does not focus on the process
e.g. It is mainly a declarative language that also includes some procedural elements that allow users to insert, query, update and control data.
- **RDBMS** (acronym): refers to a relational database management system
e.g. SQL works in systems such as RDBMS or in RDSMS in the case of stream processing.
- **web-based program** (noun): a program that can run only online
e.g. How do I know if my computer program or web-based program needs to use MySQL?

- **content management system** (noun): a software used to create web content in a collaborative environment
e.g. However, I'd like to clarify that if you are programming a blog, a photo gallery or a content management system, there you always need to put your page in a webhost using MySQL.
- **webhost** (noun): a site that can provide the service of posting a web page on the internet
e.g. However, I'd like to clarify that if you are programming a blog, a photo gallery or a content management system, there you always need to put your page in a webhost using MySQL.

Learning Points

Verbs with Infinitives: Would Like to in Interrogative and Affirmative Statements

In English, there are some *infinitive verbs* that are always followed by other verbs such as the verb *would like to*.

These verbs are always followed with the preposition *to* and they can express different meanings. When you use the infinitive verb *would like to*, it refers to the desire or the intention of doing something:

- I **would like to** understand how a database software works.

You can use *verbs with infinitives* in affirmative or interrogative forms, for instance:

- I **would like to** see how to code using MySQL.
- **Would you like to** know how to code using MySQL?

Remember that you can use the contracted form of the verb too:

- I'd **like to** see how to code using MySQL.

There are some other *infinitive verbs* with similar meaning as *would like to* such as *want to* or

Look at the chart to observe the structures:

AFFIRMATIVE STATEMENTS			
SUBJECT	VERB WITH INFINITIVE	COMPLEMENT	
<i>I</i>	<i>would like to see</i>	<i>how to code using MySQL.</i>	
INTERROGATIVE STATEMENTS			
AUXILIARY VERB	SUBJECT	VERB WITH INFINITIVE	COMPLEMENT
Would	you	like to see	<i>how to code using MySQL.?</i>

Examples

- *Would you like to give me some ideas about it?*
- *I'd like you to take into account that SQL can perform these tasks thanks to the use of relational algebra and calculus.*

Learning Points

Verbs with Infinitives in Affirmative, Negative and Interrogative Statements

In English, there are some *infinitive verbs* that are always followed by other verbs such as the verb *need to*.

These verbs are always followed with the preposition *to* and they can express different meanings. When you use the infinitive verb *need to*, it refers to the purpose of doing something:

- An organization **needs to** store lots of data in database software.

You can use *verbs with infinitives* in affirmative, negative or interrogative statements, for instance:

- You **need to** use MySQL when you use a content management system.
- You **don't need to** use MySQL when you use a content management system.
- **Do you need to** use MySQL when you use a content management system?

Look at the chart to observe the structures:

AFFIRMATIVE STATEMENTS			
SUBJECT	VERB WITH INFINITIVE	COMPLEMENT	
An organization	needs to store	lots of data in database software.	
NEGATIVE STATEMENTS			
SUBJECT	AUXILIARY VERB	VERB WITH INFINITIVE	COMPLEMENT
An organization	doesn't	need to store	lots of data in database software.
INTERROGATIVE STATEMENTS			
AUXILIARY VERB	SUBJECT	VERB WITH INFINITIVE	COMPLEMENT
Does	an organization	need to store	lots of data in database software?

Examples

- *Do we need to buy it?*
- *To create database software, we need to use SQL or "sequel", Structure Query Language.*
- *Well, you don't need to worry about it, you just have to check the system requirements page of your software and you'll know whether you need it or not.*
