Let's Start!

How can we execute an ASP.NET application?

Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor.

Represent the solution outline to the problem presented by the customer through making case of use diagrams, facing the problem to the customer following rules and protocols of the organization.

Ask your partner:

- How does the ASP.NET component model work?
- What are some features of .Net Framework?

Can Do Statements:

- I can discuss what a typical ASP.NET application consists of.
- I can talk about the contents of a project in ASP.NET.
- I can say the steps to execute a project application in ASP.NET.

Let's Explore!

Hannah is catching up* with Mr. Kapoor's web developing class.

*To "catch up" is to get information about something you missed before.

Instructions: Read the text below.

- Hannah:** I couldn't make it to Mr. Kapoor's class this morning. Did he continue talking about ASP.NET?
- Tom:** Yeah, he explained some details about applications.
- Hannah:** Did he mention the components?
- Tom:** That's right. He said that an ASP.NET application can have different items such as web content files, source files, assemblies or user controls.
- Hannah:** Did he list the extensions?
- Tom:** Yes, you'd better take notes: .aspx is for web content files, .cs for source files, .dll or .exe for assemblies and .ascx for user controls.
- Hannah:** Ok, thanks. Did you know that all those application items constitute a solution?
- Tom:** That's right, Visual Studio can create solution files once you start working on a website, these solution files may have many projects at the same time.
- Hannah:** I see. So, did Mr. Kapoor mean that a solution includes other solutions?
- Tom:** Not at all! A solution may consist of one or many more projects, but solutions can't have other solutions.
- Hannah:** Ok, I got it. What did he explain about projects?
- Tom:** Well, he said that projects are like folders to save information images, content or source files, and that the extensions of application projects can be .cproj or .vbproj.
- Hannah:** But, I think that executable files or dynamic link libraries can also store the information of a project.
- Tom:** Absolutely, .exe and .dll files store project data. They save files such as page, user control, web service, master page, site map and website configuration files.
- Hannah:** Did he bring up some points on how to run a project application?
- Tom:** Yes, Mr Kapoor gave some instructions to execute an application. First, you should open your project in VB.net and then you go to properties. Once here, you select "Local ISS server" and you select start but without debugging.

**Let's Practice!**

Do you know what a typical ASP.NET application consists of?

Instructions: Match column A with Column B.

COLUMN A

1. Did he mention the components in the class?
2. Did he list the extensions?
3. Did you know that all those application items constitute a solution?

COLUMN B

- a. Yes, aspx is for web content files, .cs for source files, .dll or .exe for assemblies and .ascx for user controls.
- b. Sure, he said that an ASP.NET application can have different items such as web content files, source files, assemblies or user controls.
- c. That's right; Visual Studio can create solution files once you start working on a website.

**Let's Practice!**

She talks about the contents of a project in ASP.NET.

*Instructions: Complete the sentences by writing its corresponding word. Use: **can also store, can have, may have, can create***

1. ASP.NET application _____ different items such as web content files, source files, assemblies or user controls.
2. Visual Studio _____ solution files once you start working on a website, these solution files _____ many projects at the same time.
3. Dynamic link libraries _____ the information of a project.

Extension Activity

Executing a project application in ASP.NET.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for extra information about the steps to execute a project application in ASP. NET.
- Summarize all the information that you found about it.
- Prepare a presentation for your classmates.
- Present your job to your classmates.

Self-Assessment

Yes

No

- I look for extra information about the steps to execute a project application in ASP.NET
- I summarize the information.
- I present an exposition to my classmates.

☐ ☐
☐ ☐
☐ ☐

Target Words

- assembly** (noun): a precompiled file that can run in a .Net application
e.g. An ASP.NET application can have different items such as web content files, source files, assemblies or user controls.
- user control** (noun): a part of a web page that can be reused or embedded to other pages
e.g. An ASP.NET application can have different items such as web content files, source files, assemblies or user controls.
- solution** (noun): a way to organize application projects in the .Net Framework
e.g. Visual Studio can create solution files once you start working on a website, these solution files may have many projects at the same time.
- dynamic link library** (noun): a DDL is a set of support files containing tools and data to create an ASP.NET application
e.g. I think that executable files or dynamic link libraries can also store the information of a project.
- master page** (noun): a layout to define the appearance of pages in an ASP.NET application
e.g. They save files such as page, user control, web service, master page, site map and website configuration files.
- bring up** (phrasal verb): to mention a subject or topic
e.g. Did he bring up some points on how to run a project application?

Learning Points

Modal Verbs Can and May for Possibility

We use the modal verbs **can** and **may** in English to express the possibility of something happening.

Both modal verbs refer to possibility but the meaning of the statement can vary. When we use the modal verb **Can**, we refer to something that has strong chances of happening or something that is considered a general truth:

- You can use ASP.NET to develop web applications.

In the case of **May**, this modal verb makes reference to something that not always happens or has less possibilities of being true:

- You may develop a lot of projects at the same time when using ASP.NET

Examples

- *Visual Studio can create solution files once you start working on a website.*
- *These solution files may have many projects at the same time.*

The Simple past Tense Questions to Ask for Confirmation

You use the **past simple tense** to describe actions that happened in a specific time in the past.

You can use simple questions in the past tense to check understanding or to ask for confirmation about a specific information.

When you ask questions, the structure is different from the affirmative and negative forms. You don't have to use the past form of the verb; you use the verb in infinitive. In addition, you need to include the auxiliary *did* at the beginning of the question.

To make questions you use the following structure:

Did + subject + verb in present + complement + ?

These are some examples:

- *Did you compile a source file before executing an application?*
- *Did he say that ASP.NET has solution modules?*
- *Did you know that solutions can have more than one project?*
- *Did you take notes of the file extensions?*

Examples

- *Did he continue talking about ASP.NET?*
- *Did you know that all those application items constitute a solution?*
- *Did he bring up some points on how to run a project application?*
