Let's Start!

Discovering facts about source code editors!

Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor. Represent the solution outline to the problem presented by the customer through making case of use diagrams, facing the problem to the customer following rules and protocols of the organization.

Ask your partner:

- What do you know about programming languages?
- What is the technique to generate an organized source code?

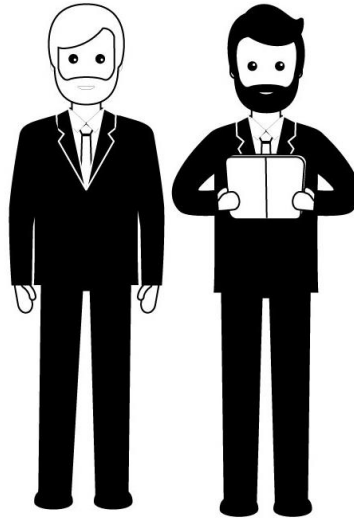

Can Do Statements:

- I can say what a source code editor is.
- I can talk about some characteristics for source code editors.
- I can list some source code editors.

Let's Explore!

Chris is taking an introductory course to programming.

Instructions: Read the text below.

Dan: Hey Chris! What's that book about?

Chris: It's about source code editors. I'm taking an introductory course to programming.

Dan: I see, but what is a source code editor?

Chris: It is the most important tool for a computer programmer. It is a text editor program, and it helps to write codes for software.

Dan: Do you find those editors online?

Chris: Well, some editors come as a standalone application in your PC, this means that they work offline; they don't need an operating system to run. Some others are part of integrated development environments (IDE), an application that integrates multiple tools at the same time, such as code text editor, debugger and build automation tools.

Dan: Why are source code editors so important for computer programmers?

Chris: Because, they make things easier and faster. A source code editor provides features to simplify programmers work such as syntax highlighting, indentation and autocomplete.

Dan: What do those features do?

Chris: Well, syntax highlighting allows programmers to read codes easily and find errors in a program. Indentation helps organizing the programming language structure and autocomplete enables word predictions while writing.

Dan: Do you have to use binary codes while programming?

Chris: Some source code editors do that automatically, they transform information to a binary form. Some editors can also compress the source code.

Dan: Very interesting, I would like to learn how to program too. Do you know some examples of source code editors?

Chris: Yes, I have some here in my book. Let me show you...These ones here are Emacs, Geany, Gedit, Sublime Text, Adobe Dreamweaver, Notepad and, Textmate; and some of them are exclusive of some systems.

Extension Activity

Let's recommend a source code editor

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for a source code editor. You can't use the editors learnt in this lesson.
- Describe it in a concept map.
- Include advantages and level of the editor you chose.
- Explain your concept map to your class.

Self-Assessment

Yes

No

1. I look for a source code editor.

☐ ☐

2. I design a concept map.

Target Words

- **standalone** (adjective): something that works independently.
e.g. Some editors come as a standalone application in your PC, this means that they work offline.
- **operating system** (noun): a program that controls and integrates all the hardware and software features in a computer.
e.g. Some editors come as a standalone application in your PC, this means that they work offline; they don't need an operating system to run.
- **debugger** (noun): a computer software that finds coding errors in computer programs.
e.g. IDE is an application that integrates multiple tools at the same time, such as code text editor, debugger and build automation tools.
- **indentation** (noun): a structure used to organize text in source codes.
e.g. Indentation helps organizing the programming language structure.
- **enable** (verb): to authorize or make able to do something.
e.g. Autocomplete enables word predictions while writing.
- **binary code** (noun): a system used to encode data using the numbers 0 and 1.
e.g. Do you have to use binary codes while programming?

Simple Present Tense Statements with Be and Other Verbs

We use the Simple Present tense to describe general ideas or facts.

When you describe something and want to talk about its qualities and characteristics, you use the present simple with the verb *to be*:

A source code editor **is** fundamental for a programmer.
It **isn't** possible to develop software without a source code editor.

You can also describe facts in *present simple* with other verbs for either interrogative or negative statements. In these cases, you use the auxiliary *do* or *does*:

A programmer **needs** a source code editor for his job.
A programmer **doesn't need** a source code editor for his job.
Source codes editors **make** programming easier.
Source codes editors **don't make** programming easier.

To conjugate the verbs in *simple present*, you should follow certain rules:

The verb *to be* is an irregular verb and you have to learn its conjugation. (Chart 1)

You conjugate *other verbs* depending on their endings. (Chart 2)

Look at the charts to observe the conjugation rules:
